# Seventh Pseudo-Boolean Competition PB12 

Vasco Manquinho and Olivier Roussel

15th International Conference on Theory and Applications of Satisfiability Testing, SAT'12

June 18, 2011

## Outline

- A few words on the competition
- Pseudo-Boolean constraints
- PBS, PBO, WBO
- Benchmarks and Solvers
- Evaluation System
- Results

## What's a competition worth?

The goal of a competition is to:

- evaluate solvers in the same conditions
- help collecting publicly available benchmarks
- help identifying new solvers on the market
- help the community identify good ideas and strange results: the goal is to raise questions and get new ideas!
Competitions should not be misunderstood:
- The results are not an absolute truth: they depend on the benchmark selection, experimental condition,...
- A competition is not limited to a ranking: rankings are just an over-simplified view, but still relevant to motivate authors
- There are a lot of data collected and published to benefit the whole community
- Competitions must be driven by the community: benchmark submission/selection advices, suggestions for improvements...

## Last PB competition?

- PB12 is the last competition organized by the current team (V. Manquinho, O. Roussel) after 7 editions, it's time for change.
- Anyone willing to organize the next competitions is welcome!

## Linear Pseudo-Boolean Constraints

- A linear pseudo-Boolean (PB) constraint may be defined over Boolean variables by

$$
\sum_{i} a_{i} \cdot l_{i} \geq d \text { with } a_{i}, d \in \mathbb{Z}, l_{i} \in\left\{x_{i}, \bar{x}_{i}\right\}, x_{i} \in \mathbb{B}
$$

Example: $3 x_{1}-3 x_{2}+2 \bar{x}_{3}+\bar{x}_{4}+x_{5} \geq 5$

- Extends both clauses and cardinality constraints
- cardinalities: all $a_{i}=1$ and $d>1$
- clauses: all $a_{i}=1$ and $d=1$
- PB constraints are more expressive than clauses (one PB constraint may replace an exponential number of clauses) but there exists good encodings to SAT.
- A pseudo-Boolean instance is a conjunction of PB constraints

## Non-Linear Pseudo-Boolean Constraints

- A non-linear pseudo-Boolean constraint may be defined over Boolean variables by

$$
\sum_{i} a_{i}\left(\prod_{j} I_{i, j}\right) \geq d \text { with } a_{i}, d \in \mathbb{Z}, l_{i, j} \in\left\{x_{i, j}, \bar{x}_{i, j}\right\}, x_{i, j} \in \mathbb{B}
$$

Example: $3 x_{1} \bar{x}_{2}-3 x_{2} x_{4}+2 \bar{x}_{3}+\bar{x}_{4}+x_{5} x_{6} x_{7} \geq 5$

- A product is a AND
- Compact encoding for several problems (e.g. factoring problem encoded by one constraint)
- Can be easily translated into linear pseudo-Boolean by introducing new variables and constraints such that

$$
p \leftrightarrow x_{0} \wedge x_{1} \wedge \ldots \wedge x_{n}
$$

(requires 2 PB constraints or $\mathrm{n}+1$ clauses)

## Different problems: PBS, PBO,...

- PBS (Pseudo Boolean Satisfaction) decide of the satisfiability of a conjunction of PB constraints (decision problem)
- PBO (Pseudo Boolean Optimization)
find a model of a conjunction of PB constraints which optimizes one objective function
$\begin{cases}\text { minimize } & f=\sum_{i} c_{i} . x_{i} \text { with } c_{i} \in \mathbb{Z}, x_{i} \in \mathbb{B} \\ \text { subject to } & \text { the conjunction of constraints }\end{cases}$

## Different problems: ... and WBO

## WBO (Weighted Boolean Optimization)

- generalization of maximum satisfiability for PB constraints
- hard constraints must be satisfied
- soft constraints may be violated, but this has a cost
- the cost of an interpretation is the sum of the costs of violated soft constraints
- as in WCSP, there is a top cost. Interpretations with a cost greater or equal to the top cost are non admissible.
- the goal is to find an admissible interpretation with the smallest cost
- to avoid any intersection with the Max-SAT competition, at least one constraint must not be a clause.

## Benchmark categories (1)

For PBS/PBO, classification based on the objective function
DEC No objective function to optimize (decision problem). The solver must simply find a solution.
OPT An objective function is present. The solver must find a solution with the best possible value of the objective function.
For WBO, classification based on the existence of hard clauses SOFT No hard clause at all.
PARTIAL At least one hard clause.

## Benchmark categories (2)

Classification based on the size of coefficients
SMALLINT small integers: no constraint with a sum of coefficients greater than $2^{20}$ (20 bits): expected to be safe for solvers using 32 bits integers and simple techniques (be careful with learning), but strong limit to the encoding of concrete problems.
BIGINT big integers: at least one constraint with a sum of coefficients greater than $2^{20}$ (20 bits): requires arbitrary precision.
Classification based on the linearity of constraints
LIN All constraints are linear
NLC At least one constraint is non linear (contains products of literals)

## Instances submitted this year

## PBS-PBO

- Optimization of a visit in a museum (S. Roussel) 2522 instances
- Optimization of cluster formation in mobile ad-hoc networks (S. Zahidi, F. Aloul, A. Sagahyroon, W. El-Hajj) 160 instances
- haplotyping with pedigrees (HwP) (A. Graça, I. Lynce, J. Marques-Silva)
100 instances actually submitted last year, but forgotten!
WBO
- third year w/o new submission!

## Instance selection

- For this last competition, every instance collected since 2005 was candidate
- Random selection with 2012 used as seed
- Huge differences in the number of instances in each series (up to thousands)
$\Rightarrow$ at most 30 instances selected in each series.

## Solvers

Submitted solvers:

- PBS/PBO: 10 different solvers, 33 versions by 8 different teams
- WBO: 8 solvers, 18 versions by 6 different teams

Unsubmitted solvers:

- Solvers from previous competitions (starting with PB07) which ranked first in a category and gave at least 100 answers
- minisatp (latest version of minisat+)
- These solvers are identified by a 'PByy:' prefix

## Categories and selected instances

- DEC-SMALLINT-LIN (355 instances)
- DEC-SMALLINT-NLC (30 instances)
- DEC-BIGINT-LIN (14 instances)
- DEC-BIGINT-NLC (0 instance)
- OPT-SMALLINT-LIN (657 instances)
- OPT-SMALLINT-NLC (124 instances)
- OPT-BIGINT-LIN (416 instances)
- OPT-BIGINT-NLC (0 instance)
- PARTIAL-SMALLINT-LIN (276 instances)
- PARTIAL-BIGINT-LIN (238 instances)
- SOFT-SMALLINT-LIN (133 instances)
- SOFT-BIGINT-LIN (46 instances)

## Evaluation environment

kindly provided by CRIL, University of Artois, France

- Cluster of bi-Xeon quad-core $2.66 \mathrm{GHz}, 8 \mathrm{MB}$ cache, 32 GB RAM
- Each solver was given a time limit of 30 minutes (1800s) and a memory limit of 15500 MB (to avoid swapping).
- 2 solvers per node (each solver is given 4 cores)
- limited interactions because of the 2 CPU and the memory limit
- only two instances of the same solver allowed to run concurrently
- 697 days of CPU time used

## Verification of results

- The environment performs the following, efficient checks:
- for SATISFIABLE answers, solvers must output a complete instantiation and the system checks that it satisfies all constraints
- for UNSATISFIABLE answers, the system only checks that no other solver proved satisfiability
- for OPTIMUM FOUND answers, solvers must output a complete instantiation; the system checks if all constraints are satisfied and that no other solver found a better solution
- UNSATISFIABLE and OPTIMUM FOUND answers cannot be completely checked efficiently and therefore should be taken with caution.
- Solvers giving a wrong answer in a category are disqualified in that category.
- Submitting a bug fix was allowed

## Ranking of solvers and Virtual Best Solver (VBS)

Ranking based on two criteria:

1. the number of solved instances
2. ties are broken by considering the cumulated time on solved instances
The Virtual Best Solver (VBS)

- is the virtual solver obtained by combining the best results of all submitted solvers.
- can be obtained by running in parallel all submitted solvers
- represents the current state of the art (SOTA)
- is a reference for the evaluation of the other solvers

## Results for DEC-SMALLINT-LIN (1/3)

| Rank Solver |  | \#solved | Detail | \%inst. | S |
| :---: | :---: | :---: | :---: | :---: | :---: |

## Some lessons

- Linear programming techniques
- dominate in optimization problems
- but are dominated in decision problems.
- In CDCL solvers,
- learning only PB constraints doesn't seem competitive,
- learning only clauses is not sufficient,
- a mixed scheme seems to be the right approach.
- Portfolios are also effective for PB problems
- Solvers don't necessarilly improve with time
<Add you own conclusion here>

## More information

- All details are on the web site http://www.cril.univ-artois.fr/PB12/
- after 7 years of competitions:
- 13512 instances ( 9.6 GB ) collected and published
- 172 solvers were run since 2006
- Thanks to all participants!
- Reminder: new organizers are expected!
